

# Class 10 Structural Bioinformatics pt 1 BIMM 143

Scott MacLeod PID: A16246401

## The PDB Database

Here we examine the size and composition of the main database of biomolecular structures - the PDB.

Get a CSV file from the PDB database and read it into R.

```
pdbstats <- read.csv("pdb_stats.csv", row.names=1)
head(pdbstats)
```

	X.ray	EM	NMR	Multiple.methods	Neutron	Other
Protein (only)	161,663	12,592	12,337	200	74	32
Protein/Oligosaccharide	9,348	2,167	34	8	2	0
Protein/NA	8,404	3,924	286	7	0	0
Nucleic acid (only)	2,758	125	1,477	14	3	1
Other	164	9	33	0	0	0
Oligosaccharide (only)	11	0	6	1	0	4
Total						
Protein (only)	186,898					
Protein/Oligosaccharide	11,559					
Protein/NA	12,621					
Nucleic acid (only)	4,378					
Other	206					
Oligosaccharide (only)	22					

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

My pdbstats data frame has numbers with commas in them. This may cause us problems. Let's see:

```
pdbstats$X.ray
```

```
[1] "161,663" "9,348" "8,404" "2,758" "164" "11"
```

```
x <- "2.22"  
as.numeric(x) +1
```

```
[1] 3.22
```

WE are going to use a function called `gsub()` which stands for global substitution. This is going to replace all the commas with an empty space in the list.

```
as.numeric(gsub(",", "", pdbstats$X.ray))
```

```
[1] 161663 9348 8404 2758 164 11
```

I can turn this snippet into a function that I can use for every column in the table.

```
commasum <- function(x) {  
  sum(as.numeric(gsub(",", "", x)))  
}  
commasum(pdbstats$X.ray)
```

```
[1] 182348
```

Now let's try to *APPLY* this to all of the columns.

```
totals <- apply(pdbstats, 2, commasum)  
totals
```

X.ray	EM	NMR	Multiple.methods
182348	18817	14173	230
Neutron	Other	Total	
79	37	215684	

Now to answer the question: From the table below, the answer is 8.72 is solved by EM.

```
round((totals / totals["Total"]) * 100,2)
```

X-ray	EM	NMR	Multiple.methods
84.54	8.72	6.57	0.11
Neutron	Other	Total	
0.04	0.02	100.00	

Q2: What proportion of structures in the PDB are protein?

```
round(commasum(pdbstats[1,7])/ totals["Total"] * 100, 2)
```

Total  
86.65

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

**PROF SAID** we are going to skip this question.

## 2. Viualizing Protein Strucutre

We will learn the basics of Mol\* (mol-star). <https://molstar.org/viewer/>

We will play with PDB code 1HSG

This is general photo of the structure

Show the ASP 25 Amino acids: These are really important so I highlighted them in green!

## Back to R and working with PDB structures

Predict the dynamic (flexibility) of an important protein:

(We are jumping down to 3 (predicting dynamics))

```
library(bio3d)  
hiv <- read.pdb("1hsg")
```

Note: Accessing on-line PDB file

```
hiv
```

Call: `read.pdb(file = "1hsg")`

Figure 1: HIV-Pr with a bound inhibitor showing the two important ASP-25 amino acids

```

Total Models#: 1
Total Atoms#: 1686, XYZs#: 5058 Chains#: 2 (values: A B)

Protein Atoms#: 1514 (residues/Calpha atoms#: 198)
Nucleic acid Atoms#: 0 (residues/phosphate atoms#: 0)

Non-protein/nucleic Atoms#: 172 (residues: 128)
Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

```

Protein sequence:

```

PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMSLPGRWKPKMIGGIGGFIKVRQYD
QILIEICGHKAIGTVLVGPTPVNIIGRNLLTQIGCTLNFPQITLWQRPLVTIKIGGQLKE
ALLDTGADDTVLEEMSLPGRWKPKMIGGIGGFIKVRQYDQILIEICGHKAIGTVLVGPTP
VNIIGRNLLTQIGCTLNF

```

```

+ attr: atom, xyz, seqres, helix, sheet,
      calpha, remark, call

```

This the first atoms of the 1HSG protein! We saw this same file in the PDB website!

```
head(hiv$atom)
```

```

Here we will do a Normal Mode Analysis (NMA) to predict functional motions of a kinase protein.

```

library("bio3d")
adk <- read.pdb("6s36")

```

Note: Accessing on-line PDB file  
PDB has ALT records, taking A only, rm.alt=TRUE

```

modes <- nma(adk)

```

```

Building Hessian...      Done in 0.028 seconds.
Diagonalizing Hessian... Done in 0.37 seconds.

```

```

plot(modes)

```

Make a “movie” called a trajectory of the predicted motions:

```
mktrj(modes, file="adk_m7.pdb")
```

Then I can open this file in Mol\*
